## 1.1 DIGITAL SYSTEMS

# DIGITAL SYSTEMS

- Digital age and information age
- Digital computers
  - General purposes
  - Many scientific, industrial and commercial applications
- Digital systems
  - Telephone switching exchanges
  - Digital camera
  - Electronic calculators, PDA's
  - Digital TV
- Discrete information-processing systems
  - Manipulate discrete elements of information
  - For example,  $\{1, 2, 3, \dots\}$  and  $\{A, B, C, \dots\}$ ...

# DIGITAL SYSTEMS

## DIGITAL SIGNAL

- The physical quantities or signals can assume only discrete values.
- Greater accuracy

## ANALOG SIGNAL

- The physical quantities or signals may vary continuously over a specified range.

# DIGITAL SYSTEMS

- Binary digital signal
  - An information variable represented by physical quantity.
  - For digital systems, the variable takes on discrete values.
    - Two level, or binary values are the most prevalent values.
  - Binary values are represented abstractly by:
    - Digits 0 and 1
    - Words (symbols) False (F) and True (T)
    - Words (symbols) Low (L) and High (H)
    - And words On and Off

# DIGITAL SYSTEMS

- Binary values are represented by values or ranges of values of physical quantities.

01100  
10110  
11110

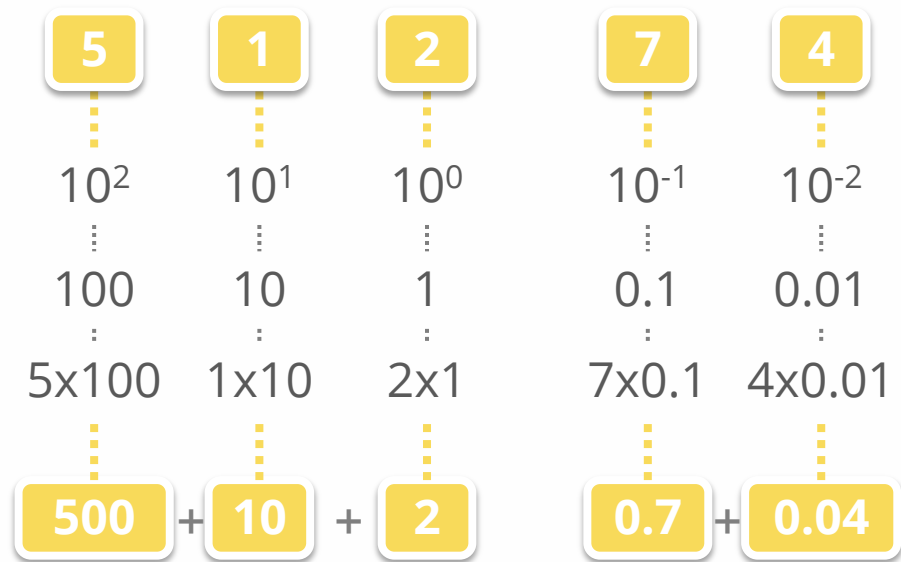

## 1.2 BINARY NUMBERS

# BINARY NUMBERS

## Decimal Number System

- Base (also called radix) = 10
  - 10 digits
  - { 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 }
- Digit Position
  - Integer & fraction
- Digit Weight
  - Weight =  $(Base)^{Position}$
- Magnitude
  - Sum of "Digit x Weight"
- Formal Notation

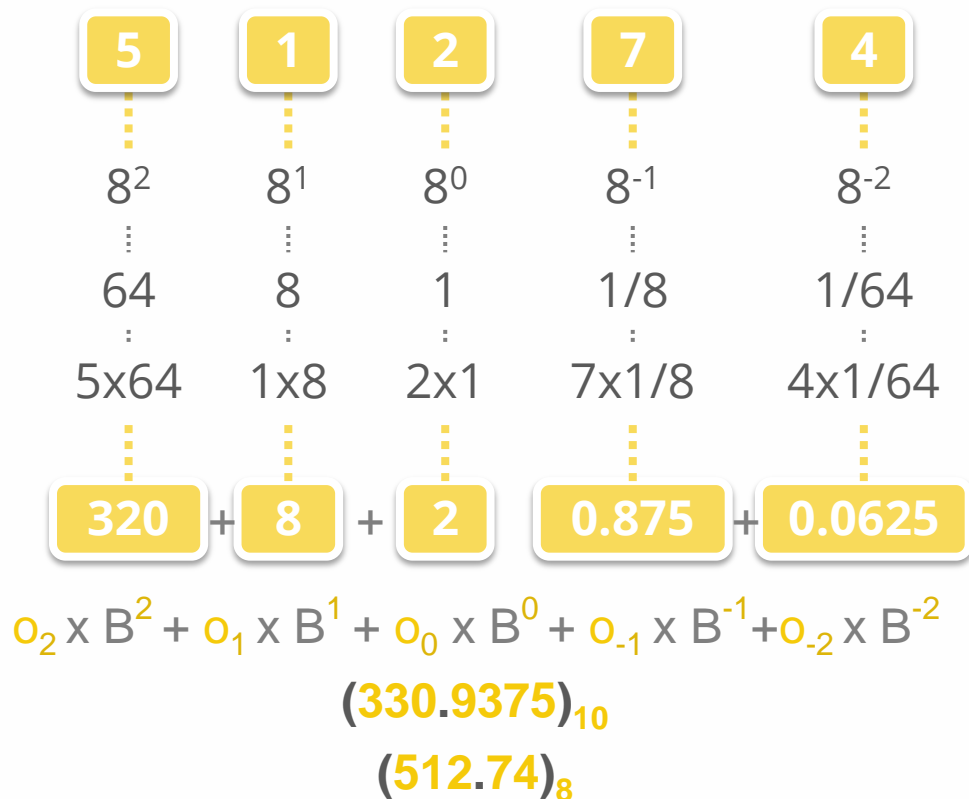

$$d_2 \times B^2 + d_1 \times B^1 + d_0 \times B^0 + d_{-1} \times B^{-1} + d_{-2} \times B^{-2}$$

$$(512.74)_{10}$$

# BINARY NUMBERS

## Octal Number System

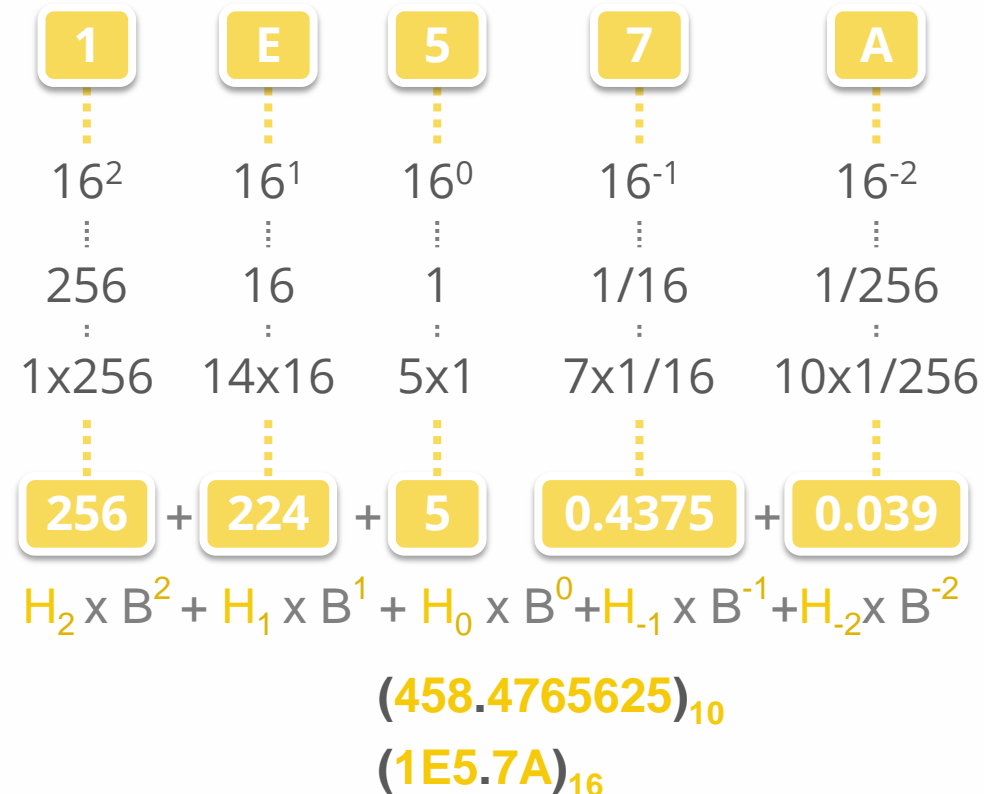

- Base = 8
  - 8 digits
  - { 0, 1, 2, 3, 4, 5, 6, 7 }
- Weights
  - Weight =  $(Base)^{Position}$
- Magnitude
  - Sum of "Digit x Weight"
- Formal Notation

# BINARY NUMBERS

## Hexadecimal Number System

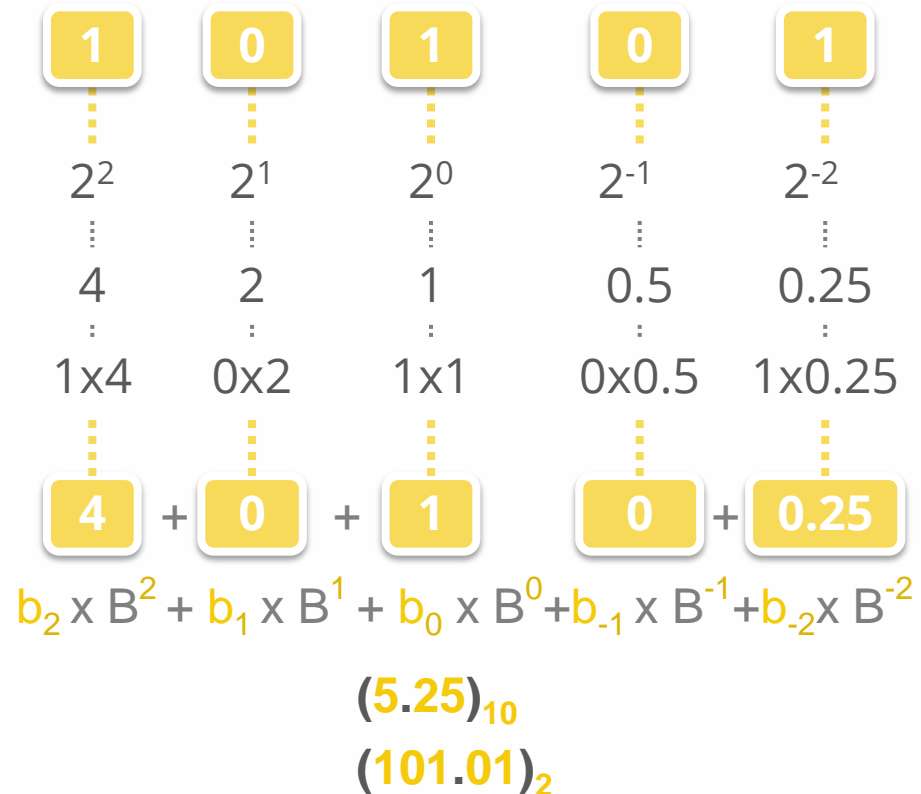

- Base = 16
  - 16 digits { 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F }
- Weights
  - Weight =  $(Base)^{Position}$
- Magnitude
  - Sum of "*bit x Weight*"
- Formal Notation

# BINARY NUMBERS

## Binary Number System

- Base = 2
  - 2 digits { 0, 1 }, called *binary digits* or "*bits*"
- Weights
  - Weight =  $(Base)^{Position}$
- Magnitude
  - Sum of "*bit x Weight*"
- Formal Notation
- Groups of bits
  - 4 bits = *Nibble*, 8 bits = *Byte*

# BINARY NUMBERS

The power of 2

n	$2^n$
0	$2^0=1$
1	$2^1=2$
2	$2^2=4$
3	$2^3=8$
4	$2^4=16$
5	$2^5=32$
6	$2^6=64$
7	$2^7=128$

n	$2^n$
8	$2^8=256$
9	$2^9=512$
10	$2^{10}=1024$
11	$2^{11}=2048$
12	$2^{12}=4096$
20	$2^{20}=1\text{M}$
30	$2^{30}=1\text{G}$
40	$2^{40}=1\text{T}$

## 1.3 BINARY ARITHMETIC

# BINARY ARITHMETIC

## ADDITION

### Decimal Addition

The diagram illustrates a step in decimal addition. It shows the addition of 155 and 55. The sum is 210. A carry of 1 is shown above the tens place. The sum 210 is shown below a horizontal line. An arrow points from the '2' in the hundreds place to the text "= Ten ≥ Base". Another arrow points from the '0' in the units place to the text "→ Subtract a Base".

$$\begin{array}{r} 1 \quad 1 \quad \leftarrow \text{Carry} \\ 5 \quad 5 \\ + 5 \quad 5 \\ \hline 1 \quad 1 \quad 0 \end{array}$$

$= \text{Ten} \geq \text{Base}$

$\rightarrow \text{Subtract a Base}$

# BINARY ARITHMETIC

## ADDITION

### Binary Addition - Column Addition

$$\begin{array}{r}
 \begin{array}{cccccc} 1 & 1 & 1 & 1 & 1 & 1 \end{array} \\
 \begin{array}{ccccccc} & 1 & 1 & 1 & 1 & 0 & 1 \end{array} \\
 + \begin{array}{ccccccc} & & 1 & 0 & 1 & 1 & 1 \end{array} \\
 \hline
 \begin{array}{ccccccc} 1 & 0 & 1 & 0 & 1 & 0 & 0 \end{array} \\
 \end{array}
 \begin{array}{l}
 \\
 = 61 \\
 = 23 \\
 = 84
 \end{array}$$

 $\geq (2)_{10}$

# BINARY ARITHMETIC

## SUBTRACTION

Binary Subtraction - Borrow a "Base" when needed

$$\begin{array}{r}
 \phantom{0}1 \phantom{0000}2 \\
 0 \cancel{2} 2 0 0 2 \quad \swarrow = (10)_2 \\
 \cancel{1} 0 0 \cancel{1} \cancel{1} 0 1 \quad = 77 \\
 - \phantom{00}1 0 1 1 1 \quad = 23 \\
 \hline
 0 1 1 0 1 1 0 \quad = 54
 \end{array}$$

# BINARY ARITHMETIC

## MULTIPLICATION

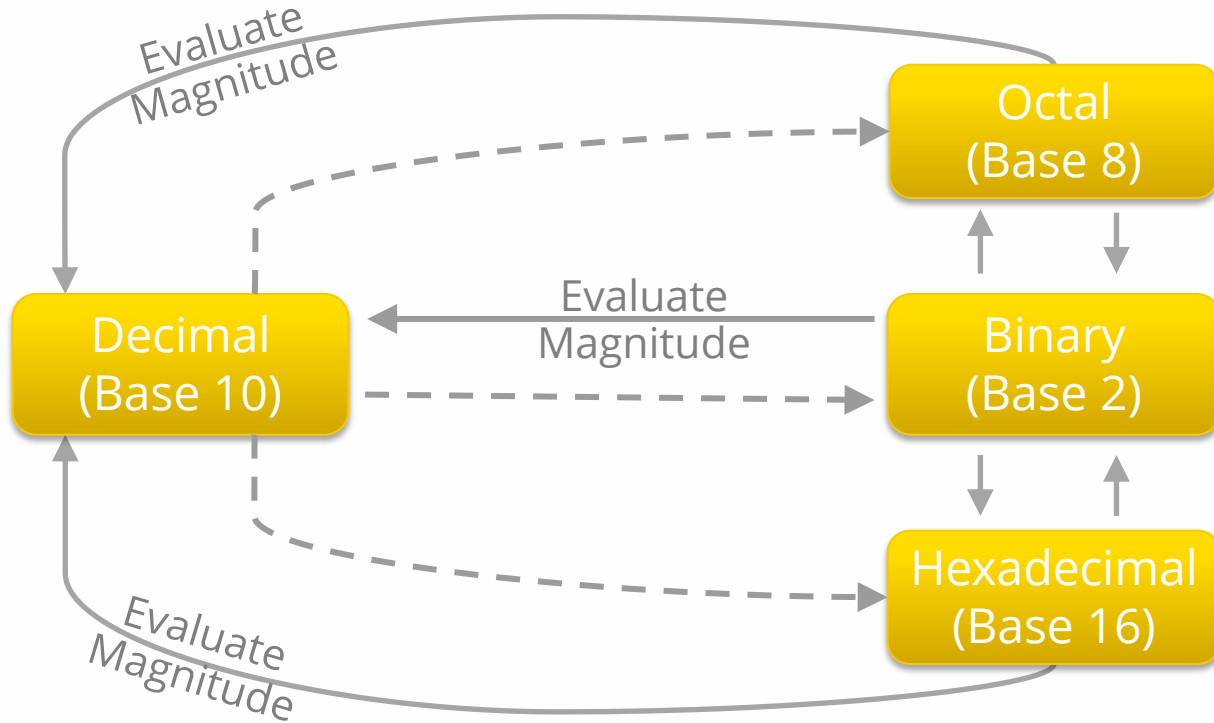

Binary Multiplication – Bit by bit

$$\begin{array}{r}
 \phantom{00000}10111 \\
 \times \phantom{00000}1010 \\
 \hline
 \phantom{00000}00000 \\
 \phantom{000}10111 \\
 \phantom{00}00000 \\
 10111 \\
 \hline
 11100110
 \end{array}$$

## 1.4 NUMBER-BASE CONVERSION

# NUMBER BASE CONVERSION

# NUMBER BASE CONVERSION

## Decimal to binary conversion

- Divide the number by the 'Base' (=2)
- Take the remainder (either 0 or 1) as a coefficient
- Take the quotient and repeat the division

# NUMBER BASE CONVERSION

Decimal (integer) to binary conversion

Example:  $(13)_{10}$

	Quotient	Remainder	Coefficient
$13 / 2 =$	6	1	$a_0 = 1$
$6 / 2 =$	3	0	$a_1 = 0$
$3 / 2 =$	1	1	$a_2 = 1$
$1 / 2 =$	0	1	$a_3 = 1$

Answer:  $(13)_{10} = (a_3 a_2 a_1 a_0)_2 = (1101)_2$

# NUMBER BASE CONVERSION

Decimal (fraction) to binary conversion

- Multiply the number by the 'Base' (=2)
- Take the integer (either 0 or 1) as a coefficient
- Take the resultant fraction and repeat the division

# NUMBER BASE CONVERSION

Decimal (fraction) to binary conversion

Example:  $(0.625)_{10}$

	Integer	Fraction	Coefficient
$0.625$	$* 2 = 1$	$. 25$	$a_{-1} = 1$
$0.25$	$* 2 = 0$	$. 5$	$a_{-2} = 0$
$0.5$	$* 2 = 1$	$. 0$	$a_{-3} = 1$

Answer:  $(0.625)_{10} = (0.a_{-1} a_{-2} a_{-3})_2 = (0.101)_2$

# NUMBER BASE CONVERSION

Decimal (integer) to octal conversion

Example:  $(175)_{10}$

	Quotient	Remainder	Coefficient
$175 / 8 =$	21	7	$a_0 = 7$
$21 / 8 =$	2	5	$a_1 = 5$
$2 / 8 =$	0	2	$a_2 = 2$

Answer:  $(175)_{10} = (a_3 a_2 a_1 a_0)_2 = (257)_8$

 **MSB**
 **LSB**

# NUMBER BASE CONVERSION

Decimal (fraction) to octal conversion

Example:  $(0.3125)_{10}$

	Integer	Fraction	Coefficient
$0.3125 * 8 =$	2	5	$a_{-1} = 2$
$0.5 * 8 =$	4	0	$a_{-2} = 4$

Answer:  $(0.3125)_{10} = (0.a_{-1} a_{-2} a_{-3})_2 = (0.24)_8$

MSB                      LSB

8

1.5 OCTAL &  
HEXADECIMAL  
NUMBERS

# OCTAL & HEXADECIMAL NUMBERS

- Binary to octal conversion
- $8 = 2^3$
- Each group of 3 bits represents an octal digit

**Example:**

**Assume Zeros**

Works **both** ways (*Binary to Octal & Octal to Binary*)

Octal	Binary
0	000
1	001
2	010
3	011
4	100
5	101
6	110
7	111

# OCTAL & HEXADECIMAL NUMBERS

- Binary to hexadecimal conversion
- $16 = 2^4$
- Each group of 4 bits represents a hexadecimal digit

**Example:**

Works **both** ways (*Binary to Hex & Hex to Binary*)

Hex	Binary
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001
A	1010
B	1011
C	1100
D	1101
E	1110
F	1111

# OCTAL & HEXADECIMAL NUMBERS

- Octal to hexadecimal conversion
- Convert to **binary** as an intermediate step

# OCTAL & HEXADECIMAL NUMBERS

Decimal	Octal	Hex	Binary
00	00	0	0000
01	01	1	0001
02	02	2	0010
03	03	3	0011
04	04	4	0100
05	05	5	0101
06	06	6	0110
07	07	7	0111
08	10	8	1000
09	11	9	1001
10	12	A	1010
11	13	B	1011
12	14	C	1100
13	15	D	1101
14	16	E	1110
15	17	F	1111

100  
1010  
01

## 1.6 COMPLEMENTS

# COMPLEMENTS

- Complements are used in digital computers to simplify the subtraction operation and for logical manipulation. Simplifying operations leads to simpler, less expensive circuits to implement the operations.
- There are two types of complements for each base- $r$  system:
  - diminished radix complement.
  - the radix complement

# COMPLEMENTS

- **Diminished Radix Complement (r-1)'s Complement**

- Given a Number =  $N$ , base =  $r$ , digits =  $n$ ,
- The  $(r-1)$ 's complement of  $N$  is defined as:

$$(r^n - 1) - N$$

- **Example for 6-digit decimal numbers:**

- 9's complement is  $(r^n - 1) - N = (10^6 - 1) - N = 999999 - N$
- 9's complement of 546700 is  $999999 - 546700 = 453299$

# COMPLEMENTS

- **For decimal numbers  $r = 10$  and**
  - $(r-1) = 9$ , this is called 9's complement of  $N$ .
  - $(10^n-1)-N$ .
  - $10^n$  represents a number that consist of a single 1 followed by  $n$  0's.
  - $10^n-1$  is a number represented by  $n$  9's.
- **For binary numbers  $r = 2$  and**
  - $r-1 = 1$ , this is called 1's complement of  $N$ .
  - $(2^n-1)-N$ .
  - $2^n$  represents a binary number that consist of a 1 followed by  $n$  0's.

# COMPLEMENTS

- For Example: 0011

$$\begin{array}{r}
 (2^4 - 1) - 0011 \\
 2^4 = 10000 \\
 \begin{array}{r}
 10000 \\
 - \quad \quad 1 \\
 \hline
 01111
 \end{array}
 \end{array}
 \quad
 \begin{array}{r}
 1111 \\
 - 0011 \\
 \hline
 1100
 \end{array}$$

- When subtracting binary digit from 1 we can have either  $1-0=1$  or  $1-1=0$  which causes bit to change from 0 to 1 or from 1 to 0.
- 1's complement of a binary is formed by changing 1's to 0's and 0's to 1's.
- Example: 0 0 1 1 0 1 1  $\rightarrow$  1 1 0 0 1 0 0

# COMPLEMENTS

- **Example for 7-digit binary numbers:**
  - 1's complement is  $(r^n - 1) - N = (2^7 - 1) - N = 1111111 - N$
  - 1's complement of 1011000 is  $1111111 - 1011000 = 0100111$
- **Observation:**
  - Subtraction from  $(r^n - 1)$  will never require a borrow
  - Diminished radix complement can be computed digit-by-digit

# COMPLEMENTS

## 1's Complement (*Diminished Radix* Complement)

- All '0's become '1's
- All '1's become '0's
- If you add a number and its 1's complement ...

$$\begin{array}{r} 1\ 0\ 1\ 1\ 0\ 0\ 0\ 0 \\ +\ 0\ 1\ 0\ 0\ 1\ 1\ 1\ 1 \\ \hline 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 \end{array}$$

# COMPLEMENTS

- **Radix Complement, the r's Complement**

- Given a Number =  $N$ , base =  $r$ , digits =  $n$ ,
  - The  $r$ 's complement of  $N$  is defined as:

$$r^n - N, \text{ for } N \neq 0 \text{ and } 0 \text{ for } N = 0.$$

- The  $r$ 's complement is obtained by adding 1 to the  $(r - 1)$ 's complement, since

$$- = [(r^n - \cancel{1}) - N] + \cancel{1}.$$

$$- = r^n - N$$

# COMPLEMENTS

- **10's complement of N can be formed:**
  - By leaving all least significant 0's unchanged.
  - By subtracting first non-zero least significant digit by 10
  - By subtracting all higher significant digits from 9.
- **2's complement of N can be formed:**
  - By leaving all least significant 0's and the first 1 unchanged and replacing 1's with 0's and 0's with 1's in all other higher significant digits.

# COMPLEMENTS

- Example: Base-10
  - The 10's complement of 012398:

$$\begin{array}{r}
 9 \ 9 \ 9 \ 9 \ 9 \ 10 \\
 - \ 0 \ 1 \ 2 \ 3 \ 9 \ 8 \\
 \hline
 9 \ 8 \ 7 \ 6 \ 0 \ 2
 \end{array}$$

- The 10's complement of 246700:

$$\begin{array}{r}
 9 \ 9 \ 9 \ 10 \ 0 \ 0 \\
 - \ 2 \ 4 \ 6 \ 7 \ 0 \ 0 \\
 \hline
 7 \ 5 \ 3 \ 3 \ 0 \ 0
 \end{array}$$

# COMPLEMENTS

- 2's Complement (*Radix* Complement)
  - Take 1's complement then add 1
  - Toggle all bits to the left of the first '1' from the right

*Example:*

Number:

1 0 1 1 0 0 0 0

1's Comp.:

1 1 1 1

0 1 0 0 1 1 1 1

or

1 0 1 1 0 0 0 0

+  
 1  
 0 1 0 1 0 0 0 0

0 1 0 1 0 0 0 0

# COMPLEMENTS

- Example: Base-2

- The 2's complement of 1101100 is 0010100

$$\begin{array}{r}
 1101100 \\
 0010011 \\
 + \quad 1 \\
 \hline
 0010100
 \end{array}
 \quad \text{or} \quad
 \begin{array}{r}
 1101100 \\
 0010100
 \end{array}$$

# COMPLEMENTS

- Example: Base-2
  - The 2's complement of 0110111 is 1001001

$$\begin{array}{r}
 0110111 \\
 1001000 \\
 + \quad 1 \\
 \hline
 1001001
 \end{array}
 \quad \text{or} \quad
 \begin{array}{r}
 0110111 \\
 1001001
 \end{array}$$

# COMPLEMENTS

- Complement of the complement restores the number to its original value
  - $r$ 's complement of  $N$  is  $r^n - N$
  - The complement of the complement is
  - $r^n - (r^n - N) = N \rightarrow$  original number

# COMPLEMENTS

- The subtraction of two  $n$ -digit unsigned numbers  $M - N$  in base  $r$  can be done as follows:
  1. Add the minuend  $M$  to the  $r$ 's complement of the subtrahend  $N$ .
    - $N$   $r$ 's complement  $= r^n - N$
    - $= M + r^n - N$
    - $= M - N + r^n$
  2. If  $M \geq N$ , the sum will produce an end carry  $r^n$ , which can be discarded; what is left is the result  $M - N$ .
  3. If  $M < N$ , the sum does not produce an end carry and is equal to  $r^n - (N - M)$ , which is the  $r$ 's complement of  $(N - M)$ . To obtain the answer in a familiar form, take the  $r$ 's complement of the sum and place negative sign in front.

# COMPLEMENT

- Example 1.5
  - Using 10's complement, subtract  $72532 - 3250$ .

$$M = 72532 \quad N = 3250$$

Step1: Take 10's complement of N

$$\begin{array}{r}
 9 \ 9 \ 9 \ 1 \ 0 \ 0 \\
 - \quad 3 \ 2 \quad 5 \ 0 \\
 \hline
 9 \ 6 \ 7 \quad 5 \ 0
 \end{array}$$

# COMPLEMENT

Step2: To find the SUM, Add 10's complement of N to M

$$\begin{array}{r} \phantom{SUM=} \phantom{+} 72532 \\ + \phantom{SUM=} 96750 \\ \hline SUM= 169282 \end{array}$$

Step3: To find the ANSWER discard end carry  $10^5$ , Subtract  $r^n$  from SUM

$$\begin{array}{r} \phantom{ANSWER=} 169282 \\ - \phantom{ANSWER=} 100000 \\ \hline ANSWER= 69282 \end{array}$$

# COMPLEMENT

- Example 1.6
  - Using 10's complement, subtract  $3250 - 72532$ .

$$M = 3250 \quad N = 72532$$

Step1: Take 10's complement of N

$$\begin{array}{r}
 9 \ 9 \ 9 \ 9 \ 1 \ 0 \\
 - \ 7 \ 2 \ 5 \ 3 \ 2 \\
 \hline
 2 \ 7 \ 4 \ 6 \ 8
 \end{array}$$

# COMPLEMENT

Step2: To find the SUM, Add 10's complement of N to M

$$\begin{array}{r}
 03250 \\
 + 27468 \\
 \hline
 30718
 \end{array}$$

SUM=

There is no end carry!

Step3: To find the ANSWER take the -(10's complement of SUM)

$$\begin{array}{r}
 9 \ 9 \ 9 \ 9 \ 1 \ 0 \\
 - 3 \ 0 \ 7 \ 1 \ 8 \\
 \hline
 6 \ 9 \ 2 \ 8 \ 2
 \end{array}$$

ANSWER=⊖6 9 2 8 2

# COMPLEMENT

Example 1.7: Given the two binary numbers  $X = 1010100$  and  $Y = 1000011$ , perform the subtraction (a)  $X - Y$  and (b)  $Y - X$  using 2's complements.

(a) Step1: Take the 2's complement of Y

1 0 0 0 0 1 1

0 1 1 1 1 0 1

Step2: Add 2's complement of Y to X

1 0 1 0 1 0 0

+ 0 1 1 1 1 0 1

---

1 0 0 1 0 0 0 1

There is an end carry!

# COMPLEMENT

Step3: Discard the end carry.

$$\begin{array}{r}
 1\ 0\ 0\ 1\ 0\ 0\ 0\ 1 \\
 +\ 1\ 0\ 0\ 0\ 0\ 0\ 0\ 0 \\
 \hline
 \end{array}$$

ANSWER= 0 0 0 1 0 0 0 1

(b)  $Y - X$ : Step1: Take the 2's complement of X

$$\begin{array}{r}
 1\ 0\ 1\ 0\ 1\ 0\ 0 \\
 0\ 1\ 0\ 1\ 1\ 0\ 0
 \end{array}$$

# COMPLEMENT

Step2: Add 2's complement of X to Y

$$\begin{array}{r}
 1\ 0\ 0\ 0\ 0\ 1\ 1 \\
 +\ 0\ 1\ 0\ 1\ 1\ 0\ 0 \\
 \hline
 \text{SUM} = 1\ 1\ 0\ 1\ 1\ 1\ 1
 \end{array}$$

There is no end carry!

Step3: To find the answer  $Y - X = -$  (2's complement of SUM)

$$\begin{array}{r}
 1\ 1\ 0\ 1\ 1\ 1\ 1 \\
 \oplus\ 0\ 0\ 1\ 0\ 0\ 0\ 1
 \end{array}$$

# COMPLEMENTS

- Subtraction of unsigned numbers can also be done by means of the  $(r - 1)$ 's complement. Remember that the  $(r - 1)$ 's complement is one less than the  $r$ 's complement.

Example 1.8 : Repeat Example 1.7, but this time using 1's complement.

(a)  $X - Y = 1010100 - 1000011 (84 - 67 = 17)$

Step 1: Take the 1's complement of Y

1 0 0 0 0 1 1

0 1 1 1 1 0 0

# COMPLEMENTS

Step2: Add 1's complement of Y to the X

$$\begin{array}{r}
 \phantom{SUM=} \phantom{+} \phantom{1} \phantom{0} \phantom{1} \phantom{0} \phantom{1} \phantom{0} \phantom{0} \\
 \phantom{SUM=} + \phantom{1} \phantom{0} \phantom{1} \phantom{1} \phantom{1} \phantom{1} \phantom{0} \phantom{0} \\
 \hline
 SUM = \phantom{+} \phantom{1} \phantom{0} \phantom{0} \phantom{1} \phantom{0} \phantom{0} \phantom{0} \phantom{0} = 16
 \end{array}$$

**There is an end carry!**  
**Sum is 1 less than the correct difference when an end carry occurs!**

Step3: Remove the end carry and add 1 (End-around carry)

$$\begin{array}{r}
 \phantom{ANSWER=} \phantom{+} \phantom{0} \phantom{0} \phantom{1} \phantom{0} \phantom{0} \phantom{0} \phantom{0} \\
 \phantom{ANSWER=} + \phantom{0} \phantom{0} \phantom{0} \phantom{0} \phantom{0} \phantom{0} \phantom{0} \phantom{1} \\
 \hline
 ANSWER = \phantom{+} \phantom{0} \phantom{0} \phantom{1} \phantom{0} \phantom{0} \phantom{0} \phantom{1} = 17
 \end{array}$$

# COMPLEMENTS

Example 1.8 : Repeat Example 1.7, but this time using 1's complement.

(a)  $Y - X = 1000011 - 1010100$  ( $67 - 84 = -17$ )

Step1: Take the 1's complement of X

1 0 1 0 1 0 0

0 1 0 1 0 1 1

# COMPLEMENTS

Step2: Add 1's complement of X to the Y

$$\begin{array}{r}
 1\ 0\ 0\ 0\ 0\ 1\ 1 \\
 +\ 0\ 1\ 0\ 1\ 0\ 1\ 1 \\
 \hline
 \text{SUM} = 1\ 1\ 0\ 1\ 1\ 1\ 0
 \end{array}$$

There is NO end carry!

Step3: To find the answer  $Y - X = - (1\text{'s complement of SUM})$

$$\begin{array}{r}
 1\ 1\ 0\ 1\ 1\ 1\ 0 \\
 \text{ANSWER} = -0\ 0\ 1\ 0\ 0\ 0\ 1 = -17
 \end{array}$$

## 1.7 SIGNED BINARY NUMBERS

# SIGNED BINARY NUMBERS

- To represent negative integers, we need a notation for negative values.
- It is customary to represent the sign with a bit placed in the left most position of the number since binary digits.
- The convention is to make the **sign bit**
  - 0 for positive and 1 for negative.
- Example
  - Signed-magnitude representation: 10001001
  - Signed-1's complement representation: 11110110
  - Signed-2's complement representation: 11110111
- Table 1.3 lists all possible four-bit signed binary numbers in the three representations.

# SIGNED BINARY NUMBERS

Decimal	Signed-2's Complement	Signed-1's Complement	Signed Magnitude
+7	0111	0111	0111
+6	0110	0110	0110
+5	0101	0101	0101
+4	0100	0100	0100
+3	0011	0011	0011
+2	0010	0010	0010
+1	0001	0001	0001
+0	0000	0000	0000
-0	-	1111	1000
-1	1111	1110	1001
-2	1110	1101	1010
-3	1101	1100	1011
-4	1100	1011	1100
-5	1011	1010	1101
-6	1010	1001	1110
-7	1001	1000	1111
-8	1000	-	-

# SIGNED BINARY NUMBERS

- Arithmetic addition
  - The addition of two numbers in the signed-magnitude system follows the rules of ordinary arithmetic.
    - If the signs are the same;
      - we add the two magnitudes and give the sum the common sign.
    - If the signs are different;
      - we subtract the smaller magnitude from the larger and give the difference the sign of the larger magnitude.

# SIGNED BINARY NUMBERS

- The addition of two signed binary numbers with negative numbers represented in signed-2's-complement form is obtained from the addition of the two numbers, including their sign bits.
- A carry out of the sign-bit position is discarded.

- Example:

$$\begin{array}{r}
 + \quad 6 \quad 0 \quad 0 \quad 0 \quad 0 \quad 0 \quad 1 \quad 1 \quad 0 \\
 + 13 \quad + 0 \quad 0 \quad 0 \quad 0 \quad 1 \quad 1 \quad 0 \quad 1 \\
 \hline
 + 19 \quad 0 \quad 0 \quad 0 \quad 1 \quad 0 \quad 0 \quad 1 \quad 1
 \end{array}$$

$$\begin{array}{r}
 - \quad 6 \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad 0 \quad 1 \quad 0 \\
 + 13 \quad + 0 \quad 0 \quad 0 \quad 0 \quad 1 \quad 1 \quad 0 \quad 1 \\
 \hline
 + \quad 7 \quad 0 \quad 0 \quad 0 \quad 0 \quad 0 \quad 1 \quad 1 \quad 1
 \end{array}$$

# SIGNED BINARY NUMBERS

- Example:

$$\begin{array}{r}
 + \quad 6 \quad 0 \quad 0 \quad 0 \quad 0 \quad 0 \quad 1 \quad 1 \quad 0 \\
 - \quad 13 \quad + \quad 1 \quad 1 \quad 1 \quad 1 \quad 0 \quad 0 \quad 1 \quad 1 \\
 \hline
 - \quad 7 \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad 0 \quad 0 \quad 1
 \end{array}$$

$$\begin{array}{r}
 - \quad 6 \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad 0 \quad 1 \quad 0 \\
 - \quad 13 \quad + \quad 1 \quad 1 \quad 1 \quad 1 \quad 0 \quad 0 \quad 1 \quad 1 \\
 \hline
 - \quad 19 \quad 1 \quad 1 \quad 1 \quad 0 \quad 1 \quad 1 \quad 0 \quad 1
 \end{array}$$

# SIGNED BINARY NUMBERS

- Arithmetic Subtraction
  - In 2's-complement form:
    1. Take the 2's complement of the subtrahend (including the sign bit) and add it to the minuend (including sign bit).
    2. A carry out of sign-bit position is discarded.

$$(\pm A) - (+B) = (\pm A) + (-B)$$

$$(\pm A) - (-B) = (\pm A) + (+B)$$

# SIGNED BINARY NUMBERS

- Example:
  - $(-6) - (-13) \rightarrow (11111010 - 11110011)$

-	6	1	1	1	1	1	0	1	0
+	13	-	0	0	0	0	1	1	0
<hr/>									
+	7	0	0	0	0	0	1	1	1

10100011  
10100011

## 1.8 BINARY CODES

# BINARY CODES

- BCD Code
  - A number with k decimal digits will require 4k bits in BCD.
  - Decimal 396 is represented in BCD with 12bits as:

- Each group of 4 bits representing one decimal digit.

# BINARY CODES

- A decimal number in BCD is the same as its equivalent binary number only when the number is between **0** and **9**.
- The binary combinations **1010** through **1111** are not used and have no meaning in BCD.

Decimal Symbol	BCD Digit
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001

# BINARY CODES

- Example:
  - Consider decimal 185 and its corresponding value in BCD and binary:

$$\begin{array}{c} (185)_{10} \\ \swarrow \quad \downarrow \quad \searrow \\ (0001\ 1000\ 0101)_{BCD} \\ = \\ (10111001)_2 \end{array}$$

# BINARY CODES

- BCD Addition
  - Consider the addition of two decimal digits in BCD
  - Since each digit does not exceed 9
  - The sum cannot be greater than  $9 + 9 + 1 = 19$ 
    - the 1 in the sum being a previous carry
  - Suppose we add the BCD digits as if they were binary numbers
  - The binary sum will produce a result in the range from 0 to 19
  - In binary this will be from 0000 to 10011, but in BCD it is from 0000 to 1 1001
    - The first 1 being a carry and the next four bits being the BCD digit sum

# BINARY CODES

- BCD Addition
  - When binary sum is equal to or less than 1001 (without a carry)
    - The corresponding BCD digit is correct
  - When the binary sum is greater than or equal to 1010
    - The result is an invalid BCD digit
  - The addition of  $6 = (0110)_2$  to the binary sum converts it to the correct digit and also produces a carry as required
  - This is because the difference between a carry in the most significant bit position of the binary sum and a decimal carry.
    - $16 - 10 = 6$

# BINARY CODES

- BCD Addition

- Consider the following three addition of two decimal digits in BCD

$$\begin{array}{r}
 4 \quad 0 \quad 1 \quad 0 \quad 0 \\
 + 5 \quad 0 \quad 1 \quad 0 \quad 1 \\
 \hline
 9 \quad 1 \quad 0 \quad 0 \quad 1
 \end{array}$$

A checkmark is placed over the result 1001.

$$\begin{array}{r}
 4 \quad 0 \quad 1 \quad 0 \quad 0 \\
 + 8 \quad 1 \quad 0 \quad 0 \quad 1 \\
 \hline
 1 \quad 2 \quad 1 \quad 1 \quad 0
 \end{array}$$

A large 'X' is placed over the result 12110. Below it, the correct BCD sum is shown:

$$\begin{array}{r}
 + 0 \quad 1 \quad 1 \quad 0 \\
 \hline
 1 \quad 0 \quad 0 \quad 1 \quad 0
 \end{array}$$

The carry '1' and the correct BCD digit sum '0010' are circled.

Carry      Correct BCD  
digit sum (2)

$$\begin{array}{r}
 8 \quad 1 \quad 0 \quad 0 \quad 0 \\
 + 9 \quad 1 \quad 0 \quad 0 \quad 1 \\
 \hline
 1 \quad 7 \quad 1 \quad 0 \quad 0 \quad 1
 \end{array}$$

A large 'X' is placed over the result 171001. Below it, the correct BCD sum is shown:

$$\begin{array}{r}
 + 0 \quad 1 \quad 1 \quad 0 \\
 \hline
 1 \quad 0 \quad 1 \quad 1 \quad 1
 \end{array}$$

The carry '1' and the correct BCD digit sum '0111' are circled.

Carry      Correct BCD  
digit sum (7)

# BINARY CODES

- The addition of two n-digit unsigned BCD numbers follows the same procedure.
  - Consider the addition of  $184 + 576 = 760$  in BCD

[illegible]

# BINARY CODES

- The representation of signed decimal numbers in BCD is similar to the representation of signed numbers in binary.
- We can use either the familiar sign and magnitude system or the signed-complement system.
- The sign of a decimal number is usually represented with four bits to conform to the 4-bit code of the decimal digits.
  - “+” with **0 0 0 0** and “-” with **1001** (BCD equivalent of 9)

# BINARY CODES

- The signed-complement system can be either the 9's or the 10's complement.
  - But the 10's complement is the one most often used.
- To obtain the 10's complement of a BCD number:
  - First take the 9's complement
    - 9's complement is calculated from the subtraction of each digit from 9.
  - Then add one to the least significant digit

# BINARY CODES

- The procedures developed for the signed-2's complement system in the previous section apply also to the signed-10's complement system for decimal numbers.
- Addition is done by:
  - adding all digits,
  - including the sign digit and
  - discarding the end carry.
- This assumes that all negative numbers are in 10's complement form.

# BINARY CODES

- Consider the addition  $(+375) + (-240) = +135$
- Step1: Find the 10's complement of  $(-240)$

$$\begin{array}{r} 9 \quad 10 \quad 0 \\ - \quad 2 \quad 4 \quad 0 \\ \hline 7 \quad 6 \quad 0 \end{array}$$

- Step 2: Add 10's complement of  $(-240)$  to 375 and discard the end carry.

$$\begin{array}{r} 0 \quad 375 \\ + 9 \quad 760 \\ \hline 0 \quad 135 \end{array}$$

# BINARY CODES

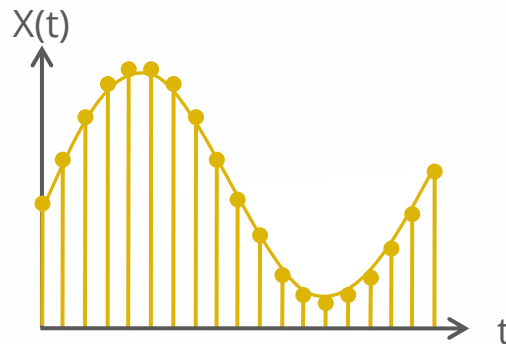

**Table 1.5**

*Four Different Binary Codes for the Decimal Digits*

<b>Decimal Digit</b>	<b>BCD 8421</b>	<b>2421</b>	<b>Excess-3</b>	<b>8, 4, -2, -1</b>
0	0000	0000	0011	0000
1	0001	0001	0100	0111
2	0010	0010	0101	0110
3	0011	0011	0110	0101
4	0100	0100	0111	0100

	1100	0111	0010	0011
	1101	1000	1101	1100
	1110	1001	1110	1101
	1111	1010	1111	1110

# BINARY CODES

- Gray code:
  - The output data of many physical systems produce quantities that are continuous.
  - These data must be converted into digital form before they are applied to a digital system.
  - Continuous or analog information is converted into digital form by means of an analog-to-digital converter.

# BINARY CODES

- Gray code:
  - It is convenient to use gray code to represent the digital data when it is converted from analog data.
  - The advantage is that only bit in the code group changes in going from one number to the next.
    - Error detection.
    - Representation of analog data.
    - Low power design.

Gray Code	Decimal Equivalent
0000	0
0001	1
0011	2
0010	3
0110	4
0111	5
0101	6
0100	7
1100	8
1101	9
1111	10
1110	11
1010	12
1011	13
1001	14
1000	15

# BINARY CODES

- American Standard Code for Information Interchange (ASCII) Character Code (Refer to Table 1.7)
- A popular code used to represent information sent as character-based data.
- It uses 7-bits to represent 128 characters:
  - 94 Graphic printing characters.
  - 34 Non-printing characters.
- Some non-printing characters are used for text format (e.g. BS = Backspace, CR = carriage return).
- Other non-printing characters are used for record marking and flow control (e.g. STX and ETX start and end text areas).

# BINARY CODES

**Table 1.7**

*American Standard Code for Information Interchange (ASCII)*

$b_4b_3b_2b_1$	$b_7b_6b_5$

FF	Form feed	FS	File separator
CR	Carriage return	GS	Group separator
SO	Shift out	RS	Record separator
SI	Shift in	US	Unit separator
SP	Space	DEL	Delete

# BINARY CODES

- ASCII has some interesting properties:
  - Digits 0 to 9 span Hexadecimal values  $30_{16}$  to  $39_{16}$
  - Upper case A-Z span  $41_{16}$  to  $5A_{16}$
  - Lower case a-z span  $61_{16}$  to  $7A_{16}$ 
    - Lower to upper case translation (and vice versa) occurs by flipping bit 6.

# BINARY CODES

- Error-Detecting Code
  - To detect errors in data communication and processing, an eighth bit is sometimes added to the ASCII character to indicate its parity.
  - A **parity bit** is an extra bit included with a message to make the total number of 1's either even or odd.
- Example:
  - Consider the following two characters and their even and odd parity:

	With even parity	With odd parity
ASCII A = 1000001	01000001	11000001
ASCII T = 1010100	11010100	01010100

# BINARY CODES

- Error-Detecting Code
  - **Redundancy** (e.g. extra information), in the form of extra bits, can be incorporated into binary code words to detect and correct errors.
  - A simple form of redundancy is **parity**, an extra bit appended onto the code word to make the number of 1's odd or even. Parity can detect all single-bit errors and some multiple-bit errors.
  - A code word has **even parity** if the number of 1's in the code word is even.
  - A code word has **odd parity** if the number of 1's in the code word is odd.
  - Example:
    - Message A: 10001001 **1** (even parity)
    - Message B: 10001001 **0** (odd parity)

## 1.9 BINARY STORAGE & REGISTERS

# BINARY STORAGE & REGISTERS

- Registers

- A **binary cell** is a device that possesses two stable states and is capable of storing one of the two states.

1/0

- A **register** is a group of binary cells. A register with  $n$  cells can store any discrete quantity of information that contains  $n$  bits.

0 1 1 0 1 0 1 1

$n$  cells  $\longrightarrow$   $2^n$  possible states

# BINARY STORAGE & REGISTERS

- A binary cell
  - Two stable state
  - Store one bit of information
  - Examples: flip-flop circuits, ferrite cores, capacitor
- A register
  - A group of binary cells
  - AX in x86 CPU
- Register Transfer
  - A transfer of the information stored in one register to another.
  - One of the major operations in digital system.
  - An example in next slides.

# BINARY STORAGE & REGISTERS

# BINARY STORAGE & REGISTER

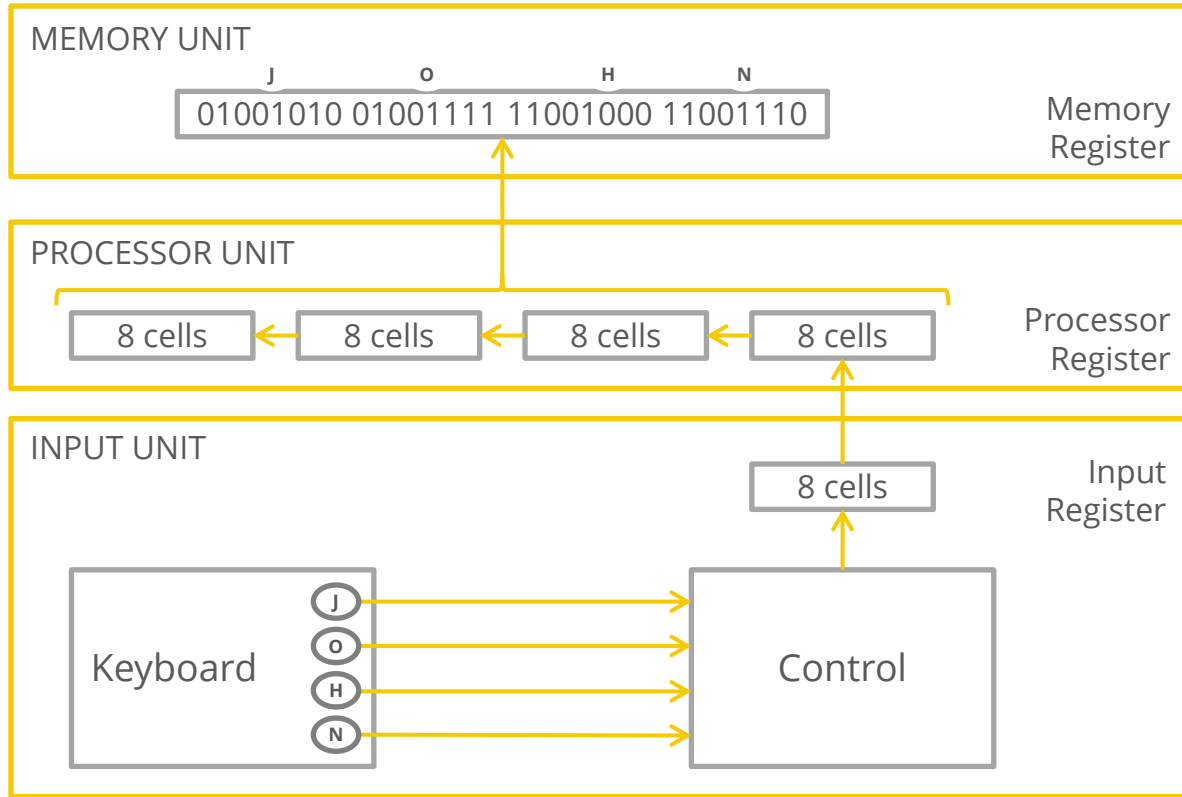

Figure 1.1 Transfer of information among register

## 1.10 BINARY LOGIC

# BINARY LOGIC

- Definition of Binary Logic
  - Binary logic consists of binary variables and a set of logical operations.
  - The variables are designated by letters of the alphabet, such as  $A$ ,  $B$ ,  $C$ ,  $x$ ,  $y$ ,  $z$ , etc., with each variable having two and only two distinct possible values: 1 and 0,
  - Three basic logical operations: AND, OR, and NOT.

# BINARY LOGIC

1. **AND** operation is represented by a dot ( $\cdot$ ) or by the absence of an operator.
  - Example:  $X \cdot Y = Z$  or  $XY = Z$ 
    - “**X AND Y** is equal to **Z**”.
    - $Z = 1$  if only  $X = 1$  and  $Y = 1$ ; otherwise  $Z = 0$ .
      - **X**, **Y** and **Z** are binary variables and can be equal either to **1** or **0**, nothing else.

# BINARY LOGIC

2. **OR** operation is represented by a plus (+).

- Example:  $X + Y = Z$ 
  - “**X OR Y** is equal to **Z**”.
  - $Z = 1$  if  $X = 1$  OR  $Y = 1$  or if both  $X = 1$  OR  $Y = 1$ .
  - If both  $X = 0$  OR  $Y = 0$ , then  $Z = 0$ .

# BINARY LOGIC

3. **NOT** operation is represented by a prim (') sometimes by an overbar ( $\bar{\phantom{x}}$ )

- Example:  $X' = Z$  or  $\bar{X} = Z$ 
  - “**NOT**  $X$  is equal to  $Z$ ”.
  - If  $X = 1$ , then  $Z = 0$ , but if  $X = 0$ , then  $Z = 1$ .
  - The **NOT** operation is also referred to as the complement operation, since it changes a **1** to **0** and a **0** to **1**.

# BINARY LOGIC

- Truth tables, Boolean expressions and Logic Gates

## AND

X	Y	Z
0	0	0
0	1	0
1	0	0
1	1	1

$$Z = X \cdot Y$$

## OR

X	Y	Z
0	0	0
0	1	1
1	0	1
1	1	1

$$Z = X + Y$$

## NOT

X	Z
1	0
0	1

$$\bar{X} = Z$$

# BINARY LOGIC

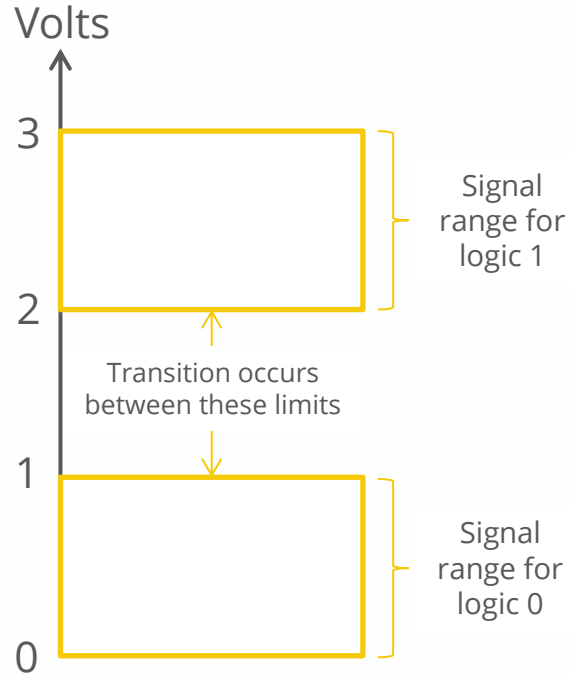

**AND**

**OR**

# BINARY LOGIC
